

Subject: XR Innovation Inquiry - UtilityPat Integration with Unreal Engine

To the Unreal Engine Developer Relations Team,

My name is Kurt Otte, founder of Koala Tea Eye Candy LLC, a veteran-led immersive tech company based in Spokane Valley, Washington. We operate a five-acre mixed-reality R&D site with zero overhead, full hardware autonomy, and a live Unreal Engine XR pipeline.

We're currently developing UtilityPat (patent pending), a real-time telemetry and hybrid motion capture platform designed for XR/VR environments. UtilityPat synchronizes motion and behavior from humans, drones, animals, and vehicles using CAN bus architecture, ESP32 telemetry modules, and IMU sensor rigs-pushing that data into responsive digital twin environments built in Unreal Engine.

This is not a conceptual framework. We are actively running:

- ESP32-based custom telemetry rigs (CAN/OBD2)
- SteamVR tracking systems (HTC Vive + trackers)
- Matterport and photogrammetry-to-Unreal pipelines
- A decentralized control logic stack integrating drone-dog-human agents

Our Ask:

We'd like to open a conversation about SDK-level access, integration feedback, or potential fit within Unreal's XR/simulation-focused partner or innovation programs. UtilityPat is Unreal-native by design, built from day one with your ecosystem as the target deployment environment.

We're interested in experimental collaboration, Marketplace feedback loops, and pushing the

potential of Unreal as a reactive mirror for real-world data systems-especially those exploring Solarpunk-aligned, decentralized simulation infrastructure.

We're prepared to provide documentation, technical prompts, and working demonstrations upon request.

Thank you for the work you're doing to evolve immersive ecosystems. We'd be honored to contribute.

Respectfully,

Kurt Otte
